PROJECTILE VERIFICATION SYSTEM

The Projectile Verification System includes both the Control Station and Containment Barrel to verify there is no projectile left in a hose, tube or pipe. They are both used in conjunction with the bench Mount Launcher. The system is designed for various applications but is most beneficial in high volume fabrication facilities where speed and efficiency are a priority.

KEY FEATURES & BENEFITS

Guarantees a projectile is never left inside a hose or tube that has been cleaned.

It tracks the number of projectiles caught and verified in the containment system letting the operator know that the projectile is no longer inside the hose or tube and counts the number of misfires for possible system reset.

The barrel catches and verifies that the projectile and contamination have been expelled.
